

Coding Problem: Guess the Price Game

Problem Definition

Create a **Price Guessing Game** in C++.

In this game, **User 1** will enter the **product name and its actual price**. Then **User 2** has to guess the price of the product.

The program should continue asking User 2 to guess the price until the correct price is entered.

Requirements

1. Ask **User 1** to enter:
 - Product name
 - Actual price of the product
2. Clear/hide the actual price so that User 2 cannot see it.
3. Ask **User 2** to enter a price guess.
4. After every wrong guess:
 - If the guessed price is **greater than the actual price**, display:

Your guess is **more than the actual price**.

- If the guessed price is **less than the actual price**, display:

Your guess is **less than the actual price**.

5. Continue taking guesses until User 2 guesses the correct price.
6. When the correct price is guessed:
 - Display a congratulation message.
 - Display the **total number of attempts** taken.

Example

Enter Product Name: Laptop
Enter Actual Price: 55000

Now Player 2, guess the price!

Enter your guess: 70000

Your guess is MORE than the actual price.

Enter your guess: 40000

Your guess is LESS than the actual price.

Enter your guess: 55000

🎉 Correct! You guessed the price.

Product: Laptop

Total Attempts: 3
